

BIODIVERSITY HUNT

Spring

Biodiversity means the variety of all living things in a particular area. The diversity of plants, animals, and micro-organisms in an area will interact with their environment to create a healthy ecosystem.

The seasons influence the biodiversity in an area due to the weather pattern of the season. For example changes in rainfall, temperature and light have a large impact on plant growth in an area which will affect other living things in that area. Therefore, we will see changes in the variety of living things in a particular area throughout the seasons.

In Ireland during springtime, we begin to see our trees and hedgerows coming to life, pollinators emerge to feed on the blossoming plants, and our migratory birds begin to return.

Match-Four

RULES: Match four squares horizontally, vertically or diagonally.

This resource was developed by Power to Change in collaboration with North Sligo Athletics Club (NSAC). Power to Change is part of the Community Climate Action Programme (Strand 2) funded by the Government of Ireland through the Department of Climate, Energy and the Environment.
